About AWIPS

- **A**dvanced
- **W**eather
- **I**nteractive
- **P**rocessing
- **S**ystem
- **D**isplay
- **2** (Two)
- **D**imensions

About AWIPS

- Graphical user interface; no command line
- Powerful one-stop mechanism for gathering and viewing all weather information pertinent to operations at National Weather Service field offices, including model output, satellite data, surface and upper-air observations, lightning, local and regional radar imagery, and redbook graphics
- Also used for issuing and disseminating text products, such as warnings and statements

About AWIPS: Pros

- Display Two Dimensions is menu-driven and intuitive, with simple controls for looping
- Large amount of operational datasets available in real-time or near real-time
- Overlay and sampling capabilities
- Four-panel displays
- Cross-section and point soundings available
- Configuration cemented with localization
- Screen captures are simple and attractive

About AWIPS: Cons

- Ability to process raw archived data quite difficult
- Decoder programming was not streamlined for consistency and uniformity
- For most datasets, reads AWIPS-formatted netCDF files only, which are difficult to create outside of the AWIPS environment
- Display Two Dimensions does not read mapping information in the header of satellite netCDF files
- Generally poor documentation, not easy to modify menu system and add products

About AWIPS: Cons

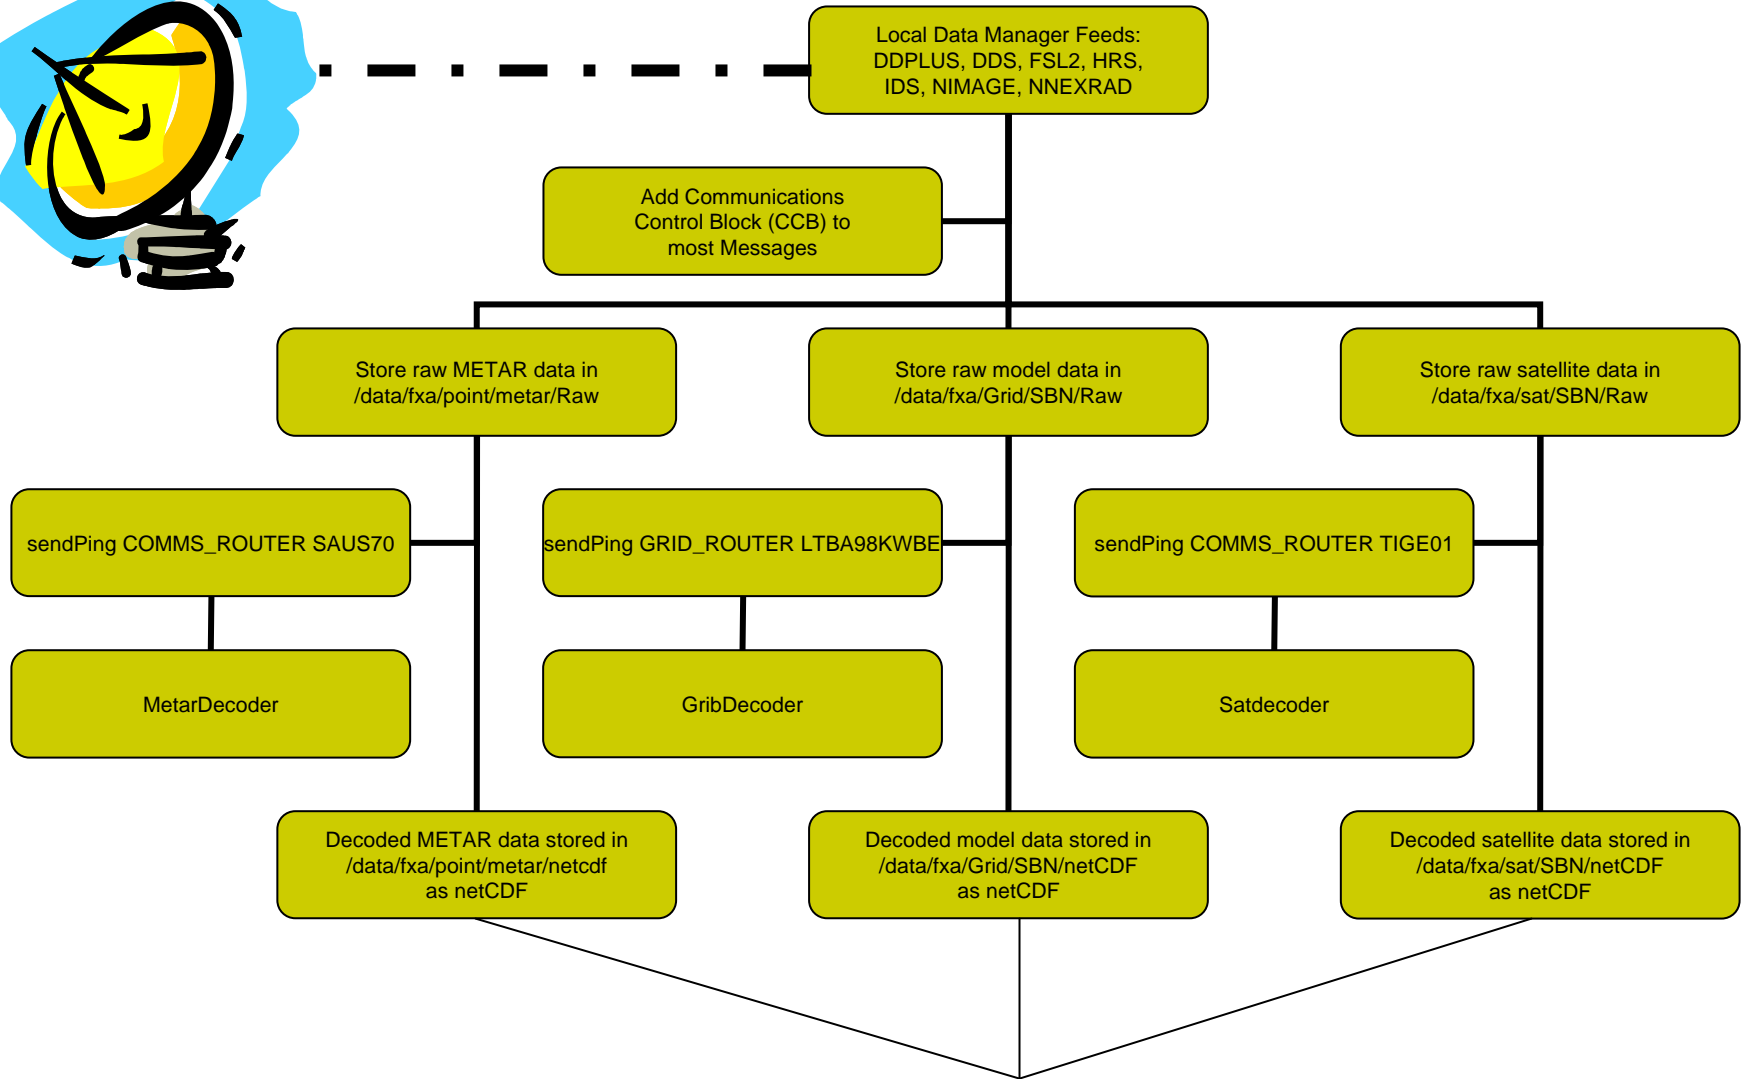

- Log files are generally not descriptive as to the actual problem when one arises
- Difficult to recover from sudden system halt
- Decoders sometimes check file name for accuracy
- Decoders must be running at all times, but some segmentation fault without notice
- Cron tasks must be set to assure purge processor runs, and that the data is ingesting
- Source code is not available
- Notification server and automatic update is finicky

Is AWIPS for you?

- Do you...
 - Have a need for current weather information?
 - Create imagery or products which could be beneficial in an operational environment?
 - Like to forecast the weather or predict where the next big snowstorm will strike?
 - Need high-quality plots in a short timeframe?
 - Wish to interact with meteorologists in the field?
 - Have an interest in other high power weather software packages like IDV and McIDAS?

AWIPS Development

- My primary tasks at CIMSS/SSEC from the fall of 2005 through the present time are:
 - Developing and maintaining a standalone AWIPS system while providing in-house user assistance
 - Optimizing the CIMSS/SSEC AWIPS experience
 - Serving as the technical focal point for NWS offices who are interested in enhancing their AWIPS satellite imagery
 - Monitoring imagery distributed to NWSFOs
 - Creating AWIPS accessories, such as Tcl GUIs

AWIPS Development

- We have different needs than NWSFOs
 - We do not issue text products, but AWIPS lets us know if a new storm cell has developed nearby
- NWSFOs ingest data from NOAAPORT into AWIPS using the acquisition server, whereas we ingest data with the Unidata Local Data Manager
 - However, we both use sendPing as the signal to the numerous decoders to check the raw data directories
- NWSFOs have a uniform naming convention for all of their machines, and some source code has these machine names compiled in
 - Standard NWS machine names are: dx, lx, na, px
 - Our names are: awipsds, galileo, kalmia, sturm, moss

AWIPS Development

- There were four key procedures that worked to get AWIPS running at CIMSS/SSEC:
 - To append the CCB header or not
 - The Communications Control Block is stripped off of products sent over the LDM, so it needs to be appended upon arrival.
 - Most CCB headers were generic, but the redbook graphics and aviation reports needed some intricate work.
 - Examining AWIPS log files for answers
 - Systems manager documentation can get you halfway for the main datasets. If lucky, your AWIPS log file may inform you of the error at that juncture. Better yet, log files from NWSFOs work wonders.

AWIPS Development

- Guess and check, guess again, then wonder
 - It is possible to navigate through the dark if you walk slowly and keep your hands in front of you.
 - Do not assume identical things at face act alike.
 - The sendPing executable signals the decoder with “magic strings” that are tricky to develop.
 - Last and final “magic string” was uncovered June 2007 to process the scatterometer winds. It consists of nearly 100 spaces.
- Obtaining insider information
 - Hot tips from AWIPS software developers, support staff, and Information Technology Officers save the day, but finding out who knows what is a problem.

AWIPS Development

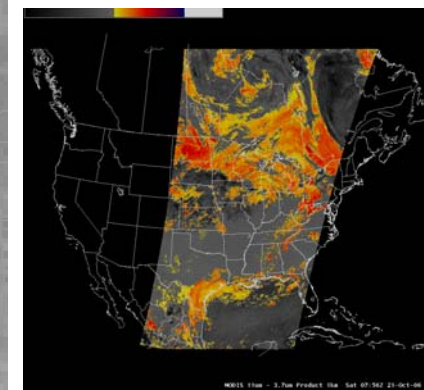

- The machine used for AWIPS development crashed in September 2005, shortly after I arrived. The only option was to start from the beginning.
- OB5 – First functioning AWIPS workstation running
- OB6 – Added SSM/I data and CIMSS color tables
- OB7.1 – Added POES imagery to satellite menu
- OB7.2 – Required work to alter GUARDIAN function
- OB8.1 – Expected to be released after July 30, 2007
- OB8.2 – Will contain new radar viewing capabilities
- OB8.3 – Likely my last AWIPS upgrade at CIMSS
- AWIPS II – The next generation of AWIPS, in Java

AWIPS Development

- The following SSEC AWIPS-compatible files are currently being provided to NWSFOs:
 - MODIS Imagery
 - Visible, Snow/Ice, Cirrus, Water Vapor, IR, Fog
 - MODIS Products
 - TPW, Cloud Phase, Cloud Top Temperature
 - MODIS Sea Surface Temperature
 - CRAS Forecast IR Window and Water Vapor
 - GOES Sounder CAPE and Ozone
 - GOES Mesoscale Winds

Developing Imagery for AWIPS

- AWIPS has benefits for CIMSS/SSEC:
 - Allowing us to work with the primary utility used by NWS forecasters to provide better training modules and exercises
 - Allowing forecasters to evaluate cutting-edge research and provide us with valuable feedback
 - Maximize use of NASA and NOAA resources

Mark Gehring and Steve Hentz, above

One Year Anniversary

- CIMSS/SSEC started providing MODIS imagery to the National Weather Service in Milwaukee/Sullivan, WI, on July 5, 2006

An Experimental Product

- First impressions are important.
 - Do not expect a second chance. Make sure training is available and questions are resolved in due time.
- Forecasters talk.
 - A good tip from a fellow forecaster is one way to guarantee the use of the experimental product will expand to other forecasters and offices.
- “Consistency. Reliability.”
 - Ken Rizzo, Meteorologist-In-Charge, MKX
 - It must be there at the same time, every day, with as little disruption as possible.

An Experimental Product

- Some forecasters will not care.
 - “I have been using the [Nested Grid Model] for the past 15 years with no problems.”
- Stuff happens. Handle it.
 - “Where did these lines come from?”
- Check back later.
 - Keep a continuing dialogue with the forecasters. If they see and talk to you frequently, they are likely to at least give your products a chance. Offices sometimes do not report outages unless you call them.
 - Create quick surveys, but nothing that takes a lot of time.
- Do lunch with the forecasters.
 - Break down the stereotypes.

Bandwidth Considerations

- Until recently, the Internet connection speed at all offices in the National Weather Service Central Region was only 96 kbps
- As a result:
 - All images have to be compressed prior to being sent over the Local Data Manager
 - File arrival has to be segmented so that the connection is not overwhelmed
 - Due to old hardware, files cannot be processed on LDAD machines at Weather Service offices

CIMSS/SSEC Imagery Distribution Network

Value to Forecaster

- **Near-term (under 12 hours) forecasts**
 - Diagnosing heavy precipitation potential
 - Total Precipitable Water (TPW)
 - Determining precipitation type
 - Snow or freezing drizzle?
- **Short-term (12 to 36 hours) forecasts**
 - Areas of fog formation (Snow?)
 - Temperatures in lakeshore areas
 - CRAS cloud assimilation
- **Post-event analysis**
 - Temperature of significant convective cells
 - Thunderstorm damage paths

Area Forecast Discussion

MAIN SHORT TERM FORECAST PROBLEM IS EAST FLOW AND MARINE LAYER INFLUENCE OVER EASTERN WISCONSIN...AND DENSE FOG POTENTIAL IN THE WEST. THINK MOST OF THE DENSE FOG WOULD BE IN THE RIVER VALLEYS...WITH A TENDENCY FOR PATCHY FOG AND SOME STRATUS AGAIN IN THE EAST WITH MORE OF A GRADIENT. MODIS 1 KM IMAGERY LAST NIGHT SHOWED THE DENSE FOG IN LONE ROCK AND BOSCOBEL WAS CONFINED TO THE IMMEDIATE WISCONSIN RIVER VALLEY...IMPORTANT INFORMATION. THE LOCAL RIVER VALLEY DENSE FOG IS NOT SEEN IN THE NORMAL 2 KM GOES. (HENTZ/MKX)

Other Forecast Discussions

- CIRRUS PREVENTING DEPICTION OF GOES SATELLITE DERIVED LI-S IN UNSTABLE AREA NEAR BOUNDARY. LI`S NEAR PLUS 10 OVER THE FAR NORTHEAST PORTION OF THE FORECAST AREA NORTH OF THE CIRRUS. SOUTHEAST. 17Z MODIS SEA SURFACE TEMPS SHOW WATERS ALONG THE WESTERN SHORE OF LAKE MI HAVE WARMED FROM YESTERDAY...NOW IN THE MID 50S TO NEAR 60 AS UPWELLING HAS ENDED WITH PERSISTENT EAST FLOW. (HENTZ/MKX)

● 22 DISCUSSIONS have mentioned MODIS

- IN ADDITION CRAS IR HAS VERY GOOD INITIAL DEPICTION OF BAROCLINIC LEAF SIGNATURE DEVELOPING OVER KANSAS AND PROGS SOUTHERN EDGE OF THIS SIGNATURE OVER WARNING AREA BETWEEN 12Z AND 15Z FRIDAY...THE BEST TIME WITH EXPECTED GFS PLACEMENT OF SURFACE LOW OVER NORTHWEST INDIANA. AT THIS TIME AMOUNTS AND TIMING OF SNOWFALL EVENT LOOK TO BE ON THE MONEY. (ZAJDEL/MKX)

● 28 DISCUSSIONS have mentioned CRAS

Future of the AWIPS Project

- CIMSS/SSEC AWIPS team participation in:
 - September 2007 Great Lakes Operational Meteorology Workshop in Milwaukee, Wisconsin
 - January 2008 American Meteorological Society Meeting
- Delivery of 250m MODIS True Color imagery to select NWSFOs starting late in the summer
- Distribution of CRAS numerical fields to CONUS and Alaska NWSFOs in GRIB2 format this fall
- Production of a MODIS-influenced sea surface temperature analysis by spring of 2008

Potential for AWIPS

- AWIPS D2D is a valuable learning tool for college students studying atmospheric science, since the federal government is the primary employer of meteorologists in the United States.
 - Integrated Data Viewer (IDV) is the only other tool available to forecasters at NWSFOs; a few have GEMPAK (mainly national centers), but AWIPS usage surpasses both of those by far.
- If designed correctly, AWIPS II may allow for a streamlined system of introducing new products to forecasters, as long as bandwidth to forecast offices is improved further.

Conclusion

- AWIPS is an excellent tool for:
 - Obtaining current weather information quickly
 - Interacting and building a relationship with the operational forecasting community
- Comments? Questions?
- If you are interested in gaining access and giving AWIPS a try, please contact me.
- There will likely be an AWIPS primer session during lunch sometime in the coming weeks.
